Arrays

By David Landau

If I didn't do a good job, my address is 2900 community avenue

What Are Arrays?

- In its most simplified form, an array is a list, and like a list, it holds information

- For Python, an array can hold strings or numbers

To get you started…

- (name of array) =[information]
- To call on a piece of an array, all you have to say is (name of array)[the number of the object]

Example

- Joe = [A, B, C, D, E, F, G]
- To call on the first piece of the array we say Joe[0] which is A
- We can switch out the values of an array by calling on an element...

  Joe[0] = B

  Print(Joe)

  [B, B, C, D, E, F, G]
